## Example 1

Let  $A$  be a set of atomic propositions. The set  $PF(A)$  of *propositional formulas over  $A$*  is the *least set* which *fulfills the following properties*:

- $a \in PF(A)$ , for any  $a \in A$  (that is,  $A \subseteq PF(A)$ );
- if  $\alpha$  and  $\beta$  are propositional formulas over  $A$ , then

$$\neg\alpha, (\alpha \vee \beta), (\alpha \wedge \beta), (\alpha \Rightarrow \beta), \text{ and } (\alpha \Leftrightarrow \beta)$$

are propositional formulas over  $A$ .

The three key features of  $PF(A)$ :

- 1 “includes  $A$ ”
- 2 “closed under”  $\neg, \vee, \wedge, \Rightarrow, \Leftrightarrow$
- 3 “least set” with the above properties

An ***n*-ary constructor** over a set  $V$  is a relation  $r$  from  $V^n$  to  $V$ . That is, the elements of  $r$  are of the form  $((a_1, \dots, a_n), a)$ .

Given an  $n$ -ary constructor  $r$  and a set  $A$ , denote by  $r(A)$  the set:

$$r(A) = \{a \mid (\exists a_1, \dots, a_n \in A) (((a_1, \dots, a_n), a) \in r)\}$$

## Definition 2

Let  $A$  be a set and  $\mathcal{R}$  be a set of constructors. The **closure of  $A$  under  $\mathcal{R}$**  is the least set  $B \subseteq V$  with the properties:

- $A \subseteq B$ ;
- $B$  is closed under  $\mathcal{R}$ , i.e.,  $r(B) \subseteq B$ , for any  $r \in \mathcal{R}$ .

## Theorem 3 (Existence of closures)

Given a set  $A$  and a set  $\mathcal{R}$  of constructors, the closure of  $A$  under  $\mathcal{R}$  exists and it is unique. Moreover, if  $\mathcal{R}[A]$  denotes the closure of  $A$  under  $\mathcal{R}$ , then

$$\mathcal{R}[A] = \bigcup_{m \geq 0} B_m,$$

where

- $B_0 = A$ ;
- $B_{m+1} = B_m \cup \bigcup_{r \in \mathcal{R}} r(B_m)$ , for any  $m \geq 0$ ;

The closure of  $A$  under  $\mathcal{R}$  is the union of a chain of sets:

$$B_0 = A, B_1 = B_0 \cup \mathcal{R}(B_0), B_2 = B_1 \cup \mathcal{R}(B_1), \dots, \bigcup_{m \geq 0} B_m = \mathcal{R}[A],$$

where  $\mathcal{R}(B_i) = \bigcup_{r \in \mathcal{R}} r(B_i)$ .

## Definition 4

The **successor** of a set  $x$ , denoted  $S(x)$ , is the set  $S(x) = x \cup \{x\}$ .

Recall that natural numbers are defined as follows:

- $0 = \emptyset$ ;
- $1 = S(0) = \{0\} = \{\emptyset\}$ ;
- $2 = S(1) = \{0, 1\} = \{\emptyset, \{\emptyset\}\}$  etc.

Therefore,  $\mathbb{N}$  is the closure of  $\{0\}$  under  $\mathcal{R} = \{S\}$ .

## Definition 5

The **reflexive closure** of a binary relation  $\rho \subseteq A \times A$  is the least reflexive binary relation  $r(\rho)$  which includes  $\rho$ .

**Fact:**  $r(\rho)$  can be computed as follows:

$$r(\rho) = \rho \cup \iota_A$$

## Definition 6

The **symmetric closure** of a binary relation  $\rho \subseteq A \times A$  is the least symmetric binary relation  $s(\rho)$  which includes  $\rho$ .

**Fact:**  $s(\rho)$  can be computed as follows:

$$s(\rho) = \rho \cup \rho^{-1}$$

# Closures of a binary relation

## Definition 7

The **transitive closure** of a binary relation  $\rho \subseteq A \times A$  is the least transitive binary relation  $t(\rho)$  which includes  $\rho$ .

**Fact:**  $t(\rho)$ , also denoted by  $\rho^+$ , can be computed as follows:

$$t(\rho) = \rho^+ = \bigcup_{m \geq 1} \rho^m,$$

where

- $\rho^1 = \rho$  and
- $\rho^{m+1} = \rho \circ \rho^m$ , for all  $m \geq 1$ .

## Definition 8

The **reflexive and transitive closure** of a binary relation  $\rho \subseteq A \times A$  is the least reflexive and transitive binary relation  $\rho^*$  which includes  $\rho$ .

**Fact:**  $\rho^*$  can be computed as follows:

$$\rho^* = t(r(\rho)) = r(t(\rho)) = \bigcup_{m \geq 0} \rho^m,$$

where

- $\rho^0 = \iota_A$  and
- $\rho^{m+1} = \rho \circ \rho^m$ , for all  $m \geq 0$ .

## Definition 9

The **closure under equivalence** of a binary relation  $\rho \subseteq A \times A$  is the least equivalence relation  $\text{equiv}(\rho)$  which includes  $\rho$ .

**Fact:**  $\text{equiv}(\rho)$  can be computed as follows:

$$\text{equiv}(\rho) = t(s(r(\rho))) = t(r(s(\rho))) = r(t(s(\rho))).$$

## Remark 1

In general,  $s(t(\rho)) \neq t(s(\rho))$ .

## Theorem 10 (Structural induction)

Let  $B = \mathcal{R}[A]$  be the closure of  $A$  under  $\mathcal{R}$  and let  $P$  be a property such that:

- $P(a)$ , for any  $a \in A$ ;
- $(P(a_1) \wedge \dots \wedge P(a_n) \Rightarrow P(a))$ , for any  $r \in \mathcal{R}$  and  $a_1, \dots, a_n, a \in B$  with  $((a_1, \dots, a_n), a) \in r$ .

Then,  $P$  is satisfied by any  $a \in B$ .

## Remark 2

- **Structural induction is equivalent to mathematical induction.**
- Structural induction is more appropriate for proving properties of closures than mathematical induction.

## Example 11

Let  $A$  be a set of atomic propositions. The set  $PF(A)$  of *propositional formulas* as defined in Example 1 is the closure of  $A$  under some set of constructors (*prove it!*).

Let  $P(\alpha)$  be the following property:

$P(\alpha) : \alpha$  has as many left brackets as right brackets.

By structural induction we can easily prove that  $P$  is satisfied by all propositional formulas over  $A$  (*prove it!*).

## Definition 12

A set  $B$  is *inductively defined by  $A$  and  $\mathcal{R}$*  if  $B = \mathcal{R}[A]$ .

If  $B = \mathcal{R}[A]$ , then  $B$  is obtained as follows:

- $B_0 = A$ ;
- $B_{m+1} = B_m \cup \mathcal{R}(B_m)$ , for all  $m \geq 0$ ;
- $B = \bigcup_{m \geq 0} B_m$ .

If the chain

$$B_0, B_1, B_2, \dots, B_m, B_{m+1} = B_m, B_{m+2} = B_m, \dots$$

stabilizes to some set  $B_m$ , then its union is  $B_m$  and, therefore,  $B = B_m$ .

A definition by induction corresponds to the following while-loop (that might be non-terminating):

---

## Algorithm 1: Computing closures

---

**input** : set  $A$  and set  $\mathcal{R}$  of constructors;

**output**:  $B = \mathcal{R}[A]$ ;

**begin**

$B := A$ ;

**while**  $\mathcal{R}(B) \not\subseteq B$  **do**

$B := B \cup \mathcal{R}(B)$

**end**

---

Assume that  $B$  is inductively defined by  $A$  and  $\mathcal{R}$ . It would be a good idea to define functions  $f$  on  $B$  in a **recursive** way as follows:

- define  $f$  for any  $a \in A$ ;
- if  $((a_1, \dots, a_n), a) \in r$  and the function has already been defined for  $a_1, \dots, a_n$ , then define the function for  $a$  as a combinations of the values  $f(a_1), \dots, f(a_n)$  in the form

$$h(r)(f(a_1), \dots, f(a_n)),$$

where  $h$  associates a (partial) function  $h(r)$  to  $r$ .

Course readings

The definition above has a main drawback: **it could not work for some sets  $B$** . Just think that the element  $a$  above might be defined in at least two different ways,

$$((a_1, \dots, a_n), a) \in r$$

and

$$((a'_1, \dots, a'_m), a) \in r'.$$

In such a case, you must be assured that

$$h(r)(f(a_1), \dots, f(a_n)) = h(r')(f(a'_1), \dots, f(a'_m)).$$

The easiest way to have this property fulfilled is to ask for each element  $a \in B$  to have exactly one inductive construction of it from  $A$  and  $\mathcal{R}$ . If  $B$  has this property then it is called a **free inductively defined set**.

However, for inductively defined sets we can prove the following result:

## Lemma 13

Let  $B = \mathcal{R}[A]$ ,  $C$  a set,  $g : A \rightarrow C$ , and  $h$  a function which associates a partial function  $h(r) : C^n \rightarrow C$  to each  $r \in \mathcal{R}$ , where  $n$  is the arity of  $r$ . Then, there exists a unique relation  $f \subseteq B \times C$  such that:

- (1)  $(a, g(a)) \in f$ , for any  $a \in A$ ;
- (2) if  $(a_1, b_1), \dots, (a_n, b_n) \in f$ ,  $((a_1, \dots, a_n), a) \in r$  and  $h(r)(b_1, \dots, b_n) \downarrow$ , then  $(a, h(r)(b_1, \dots, b_n)) \in f$ ;
- (3)  $f$  is the least relation from  $B$  to  $C$  which satisfies (1) and (2).

## Definition 14

A set  $B$  is called *free inductively defined* by  $A$  and  $\mathcal{R}$  if, for any  $a \in B$ ,

- either  $a \in A$ ,
- or there exists a unique  $r \in \mathcal{R}$  and a unique  $n$ -tuple  $(a_1, \dots, a_n)$  such that  $((a_1, \dots, a_n), a) \in r$ , where  $n$  is the arity of  $r$  (for  $n = 0$  we understand that  $a \in r$ ).

Now, we can obtain the following important result.

## Theorem 15 (Recursion theorem)

Let  $B$ ,  $C$ ,  $g$ , and  $h$  as in Lemma 13. If  $B$  is free inductively defined by  $A$  and  $\mathcal{R}$ , then the binary relation  $f$  from Lemma 13 is a function.

A slight extension of the recursion theorem is the following:

## Theorem 16

Let  $B = \mathcal{R}[A]$ ,  $C$  a set,  $g : A \rightarrow C$ , and  $h$  a function which associates a partial function  $h(r) : B^n \times C^n \rightarrow C$  to each  $r \in \mathcal{R}$ , where  $n$  is the arity of  $r$ . If  $B$  is free inductively defined by  $A$  and  $\mathcal{R}$ , then there exists a unique function  $f : B \rightarrow C$  such that:

- (1)  $f(a) = g(a)$ , for any  $a \in A$ ;
- (2)  $f(a) = h(r)(a_1, \dots, a_n, f(a_1), \dots, f(a_n))$ , for any  $a, a_1, \dots, a_n$  with  $((a_1, \dots, a_n), a) \in r$  and  $h(r)(a_1, \dots, a_n, f(a_1), \dots, f(a_n)) \downarrow$ , where  $n$  is the arity of  $r$ .

## Example 17

Let  $PF(A)$  be the set of propositional formulas over  $A$ . It is easy to see that this set is free inductively defined.

Define a function  $f : PF(A) \rightarrow \mathbb{N}$  in a recursive way as follows:

- $f(a) = 1$ , for any  $a \in A$ ;
- $f(\neg\alpha) = f(\alpha)$ , for any  $\alpha \in PF(A)$ ;
- $f((\alpha \vee \beta)) = f(\alpha) + f(\beta)$ , for any  $\alpha, \beta \in PF(A)$ ;
- $f((\alpha \wedge \beta)) = f(\alpha) + f(\beta)$ , for any  $\alpha, \beta \in PF(A)$ ;
- $f((\alpha \Rightarrow \beta)) = f(\alpha) + f(\beta)$ , for any  $\alpha, \beta \in PF(A)$ ;
- $f((\alpha \Leftrightarrow \beta)) = f(\alpha) + f(\beta)$ , for any  $\alpha, \beta \in PF(A)$ .

The function  $f$  returns the *length of propositional formulas*.

**Pick up your favorite programming language and:**

- show that its set of arithmetic and logic expressions is inductively defined;
- define recursively the length of an arithmetic expression;
- define inductively the set of variables of an arithmetic expression;
- define recursively the “height” of an arithmetic expression.

# Definitions by recursion

An important particular case of the recursion theorem:

## *Theorem 18 (Recursion theorem for $\mathbb{N}$ )*

Let  $A$  be a set,  $a \in A$ , and  $h : \mathbb{N} \times A \rightarrow A$  be a function. Then, there exists a unique function  $f : \mathbb{N} \rightarrow A$  such that:

- (1)  $f(0) = a$ ;
- (2)  $f(n + 1) = h(n, f(n))$ , for any  $n$ .

This result can be strengthened to:

## *Theorem 19 (Parametric recursion theorem for $\mathbb{N}$ )*

Let  $A$  and  $P$  be sets, and  $g : P \rightarrow A$  and  $h : P \times \mathbb{N} \times A \rightarrow A$  be two functions. Then, there exists a unique function  $f : P \times \mathbb{N} \rightarrow A$  such that:

- (1)  $f(p, 0) = g(p)$ , for any  $p \in P$ ;
- (2)  $f(p, n + 1) = h(p, n, f(p, n))$ , for any  $p \in P$  and  $n \in \mathbb{N}$ .

Addition, multiplication, and exponentiation on natural numbers are defined by recursion:

- **Addition:**

- $x + 0 = x$
- $x + (n + 1) = (x + n) + 1;$

- **Multiplication:**

- $x \cdot 0 = 0$
- $x \cdot (n + 1) = (x \cdot n) + x;$

- **Exponentiation:**

- $x^0 = 1$
- $x^{n+1} = (x^n) \cdot x.$

In some cases the value of a function  $f$  at a natural number  $n$  may depend on the values of  $f$  at  $0, \dots, n-1$  (Fibonacci's sequence is such an example).

The recursion in such cases is called **hereditary**.

## *Theorem 20 (Hereditary recursion theorem)*

Let  $A$  be a set,  $S = \bigcup_{n \in \mathbb{N}} A^n$ , and  $h : \mathbb{N} \times S \rightarrow A$  be a function. Then, there exists a unique function  $f : \mathbb{N} \rightarrow A$  such that

$$f(n) = h(n, f|_n),$$

for any  $n \in \mathbb{N}$  (recall that  $f|_0 = f|_\emptyset = \emptyset \in A^0$ ).

**Exercise:** Develop a parametric version of the hereditary recursion theorem.
